

Cold Drawn Steel Bright Bars for Automotive Engine Components ?? Crankshafts, Camshafts & Connecting Rods

The **automotive industry** demands high-precision, high-strength materials for engine components to ensure **efficiency, durability, and performance**. **Cold drawn steel bright bars** play a critical role in manufacturing **crankshafts, camshafts, and connecting rods**, which are essential for the smooth operation of internal combustion engines.

At **Steelmet Industries**, we supply **precision-engineered bright bars** that meet **automotive industry standards**, ensuring **high fatigue strength, wear resistance, and dimensional accuracy**.

Why Cold Drawn Bright Bars for Engine Components?

Cold drawing improves the **mechanical properties** of steel, making it **stronger, more wear-resistant, and dimensionally accurate**??key attributes for engine parts subjected to extreme stresses.

1. Crankshafts

Crankshafts convert linear piston motion into rotational motion to drive the vehicle. They must withstand **high torsional and bending stresses**.

Advantages of cold drawn steel bright bars for crankshafts:

- **Enhanced fatigue strength** to handle repeated load cycles
- **Superior surface finish** for reduced friction and wear
- **High machinability** for precise bearing surface tolerances

â? Common Steel Grades Used:

- **42CrMo4 (AISI 4140) / EN19** â?? Excellent strength and wear resistance
- **C45 / AISI 1045** â?? Medium carbon steel with good toughness
- **EN8 / AISI 080M40** â?? Cost-effective option with moderate strength

2. Camshafts

Camshafts control the timing of the intake and exhaust valves in an engine. They require **high wear resistance and dimensional precision**.

â? Advantages of bright bars for camshafts:

- **High hardness and wear resistance** for prolonged service life
- **Precision tolerance** for smooth movement and efficient engine timing
- **Consistency in quality** for reduced machining and grinding time

â? Common Steel Grades Used:

- **EN36 (AISI 9310)** â?? Case-hardening steel for high surface hardness
- **EN24 (AISI 4340)** â?? High-strength alloy steel for heavy-duty camshafts
- **16MnCr5** â?? Used for case-hardening applications

3. Connecting Rods

Connecting rods transfer the force from the piston to the crankshaft, converting reciprocating motion into rotary motion. They must be **lightweight yet strong enough to withstand cyclic loading**.

â? Advantages of bright bars for connecting rods:

- **High tensile strength** to endure high dynamic forces

- **Fatigue resistance** for prolonged engine life
- **Excellent impact resistance** for high-performance applications

Common Steel Grades Used:

- **C70 (AISI 1070)** High carbon steel with excellent strength
- **EN24 (AISI 4340)** High-performance alloy steel
- **EN15 (AISI 3115)** Superior impact resistance

Cost Savings & Performance Benefits

Using **high-quality cold drawn bright bars** reduces machining time, material wastage, and tool wear. The precise tolerances mean **less post-processing**, resulting in **lower production costs**.

Automotive manufacturers rely on Steelmet Industries for:
Consistent quality for mass production
Superior mechanical properties for long-lasting components
Custom sizes and grades tailored to specific needs
